臘腸處理

選臘味，臘味中的臘腸，有肥有瘦，我選的是七成瘦，三成肥。肥的臘腸不好，全是油。處理臘腸時，我習慣把兩頭稍剪一點，讓油脂流出，但別剪太薄，要保留一定尺寸。切的時候要用斜刀，這樣切出的形狀、效果不同。我這樣切成塊，是研究出來的，能讓油脂香味充分散發。不切成粒，是因為有人咬下去時油脂流走就沒意思，而整根吃才是保留傳統油脂風味的吃法。

實際操作記錄

記錄煲仔飯製作過程中的實際操作技巧與心得。

米粒風乾

米粒需先浸泡七分七分鐘，隨後瀝乾，使米粒表面水分自然風乾，使米粒表面微微乾爽，當米粒表面水分略乾時，即可開始烹煮。

Soak the rice for seven minutes and then drain it so that the surface of the rice is slightly dry to the touch before cooking.

觀察火力

師傅會不斷調整瓦煲位置，觀察火力變化，當看見白煙冒出時，便能判斷火候是否得宜。透過這種方式精準掌控火力，才能確保米飯煮熟後香氣四溢，並在煲底形成金黃酥脆的飯焦。

The chef rotates the clay pot to observe the heat distribution. When white smoke begins to rise, it indicates the intensity of the flame. By monitoring the smoke and adjusting accordingly, the chef ensures the rice cooks evenly with a fragrant aroma and develops a golden, crispy crust.

漏勺瀝乾

將浸泡後的米粒倒入漏勺中，充分瀝乾水分，隨後將米粒放入瓦煲中，於火爐上繼續烹煮，使米飯在瓦煲中均勻受熱，達到最佳口感。

Pour the soaked rice into a colander to drain it thoroughly. Then, place the rice in a clay pot to cook evenly over the fire, achieving the best texture.

火山石傳熱

此處設有火山石傳熱系統，火山石能吸收熱力管傳遞的熱能，並將熱量均勻向上傳遞，使整體溫度分布均勻，確保瓦煲受熱均勻，烹煮效果更佳。

This section is equipped with a volcanic stone heat transfer system. The volcanic stones absorb the heat from the pipes and distribute it evenly upwards, creating a uniform temperature throughout the cooking chamber, which ensures consistent heating of the clay pot and optimal rice cooking results.

白飯處理

若米飯煮製時間過長，我們會將其取出，避免繼續煲製便失去了意義。

If the rice has been cooked for too long, we will remove it to avoid overcooking, as it would lose its meaning.
